> AUSTRALIAN BAD BREATH CLINIC

How an Aussie Dentist is winning the war against bad breath worldwide

Dr Geoffrey Speiser is a dentist with more than 25 years experience in treating patients with all sorts of dental problems. He is also the director of a bad breath clinic in Edgedcliff in Sydney's Eastern Suburbs. We decided to question him on this most embarrassing condition.

Q: Who is at risk of bad breath? Serious bad breath or halitosis occurs when the natural bacteria of the mouth are disrupted. This can often happen when someone takes long term medications such as antibiotics or most prescription medicines.

Also people who suffer with allergies or have nasal stuffiness with associated post nasal drip are prime candidates for bad breath.

Q: What about dieting, is that a problem?

Yes, most definitely. Dieting causes a particular nasty type of breath that is very difficult to remove. The body releases ketones when it breaks down body fats for energy. Users of the Atkins diet would be particularly aware of having smelly ketone breath.

Q: So what can we do to stop a breath problem?

There are many treatments currently available to treat bad breath, from supermarket mouthwash to natural colon cleanses. Our clinic has developed the world's first "Three Step Program" to eradicate bad breath and sour, bitter taste. We call it **KForce Probiotic Breath Kit**.

Suffer from these...
You may have bad breath!

- 1 SLEEP APNEA OR SNORING
- 2 A SOUR OR METALLIC TASTE
- 3 A COATING ON YOUR TONGUE
- 4 DRY MOUTH OR THICK SALIVA
- 5 POST NASAL DRIP OR STUFFINESS
- 6 TAKE PRESCRIPTION MEDICINES

"The bad taste in my mouth was evident, and my husband assured me it was not pleasant. I was pleased to see your website. I would like to thank Dr Speiser for the enduring good work. No more morning breath, and a clean tongue - BRILLIANT"
